

FOR IMMEDIATE RELEASE

New Sci-Fi Adventure Packs Powerful Eco-Warning to Earth Inhabitants

MAY 20, 2011: Author Dustin Kuhlman's debut novel, *Warned* brings Sci-Fi adventure to new Eco-Friendly awareness levels. As the green house effect makes Earth's biosphere unable to sustain life, mankind is forced to populate other planets in order to survive as a species. While searching Mars, scientist Jon Castel encounters an omnipotent intelligent alien being, he named Buddy. The dual plots – one of Earth's demise and the other of Buddy's philosophy conversing with Jon Castel make for an unforgettable and unique read for all Sci-Fi enthusiasts.

Dustin Kuhlman believes in the existence of intelligent extraterrestrial alien life. During a recent interview, he said, "When you start to learn about how big the observable Universe is, it appears to be all but certain. Then there is the part of the Universe that we cannot observe and even more intriguing is the possibility of countless other Universes, so to me it's not if, but where." His character Buddy exemplifies many of Kuhlman's personal beliefs as to the physics of how extraterrestrial life might manifest itself. "I realize the chance of two intelligent species coming across each other is remote. Due to their time in existence and location relative to one another, crossing paths would be rare," he admitted.

Ecologically conscious, Dustin Kuhlman wishes to warn the public there is no "free lunch" to burning fossil fuels, and mankind's carbon footprint may in fact be stepping out their own existence. "My hope is that *Warned* will inspire others, just as I have been inspired. I also plan to become carbon neutral or negative sometime in the next decade. I know I will tread softly on this Earth, so the challenge is getting others to act in similar ways by informing and inspiring them."

Warned is available on Amazon.com, Barnes & Noble. Look for their review on www.pacificbookreview.com.
